

Why Companies Are Embracing SD-WAN

The use of software-defined wide-area networking is a rising trend in the world of IT. This new approach to managing enterprise software and apps has plenty of benefits that have made it an irresistible option for companies worldwide - and it might work for you, too

Cost-effectiveness:

Private internet connections and hardware can be costly and hard to obtain. SD-WAN uses encrypted VPN tunnels to provide secure and affordable network functionality.

Performance benefits for apps:

SD-WAN improves the speed and reliability of both internal and cloud-based apps using advanced techniques like link grouping, smart path selection, and error correction.

Low latency cloud access:

SD-WAN ensures strong, reliable connections to popular SaaS apps like Salesforce or Hubspot by using backup cloud gateways.

Priority for important apps:

Administrators can prioritize important software for a more stable network, either by setting global rules or selecting specific apps.

Remote diagnostics & custom alerts:

The SD-WAN control layer allows you to closely examine apps and offers centralized tools like router resets, ping tests, and system flushes for troubleshooting.

Fast, simplified deployment:

Private network setup can take months, but SD-WAN can be ready in just a fraction of that time.

Not every SD-WAN provider offers the same level of functionality and performance. Connect with our AMG Team at amgteam@sangoma.com to learn how we can transform your IT for the better.
